wheat sourdough

White + 25% whole wheat on lievito madre, a stiff 43% starter — my standard, super-active one, the starter I baked bread and pastry on at my bakery. Different starter? Don't worry, the recipe adapts. Dough hydration 75%. Sounds scary, it's simple.

white + whole wheat

75%	43%
HYDRATION	STARTER

1 night
COLD PROOF

what goes in

ingredient	small loaf 600 G	big loaf 1150 G
starter · 43%	71 g	137 g
whole wheat flour	85 g	163 g
white bread flour	204 g	391 g
water	233 g	446 g
salt	7 g	13 g

Starter 43% = 21% of the flour. Inside it: 50 g flour + 21 g water (600 g loaf), 96 g flour + 41 g water (1150 g loaf).

liquid starter 100%?

a	Swap so the flour and water in the dough stay the same.
b	600 g: starter 100 g (not 71), water 204 g (not 233). Everything else the same.
c	1150 g: starter 192 g (not 137), water 391 g (not 446). Everything else the same.
d	Any other starter: it must carry 50 g / 96 g of flour; cut the dough water by whatever it brings above 21 g / 41 g.

Mine is Caputo Nuvola, 12.5%. Tools that matter: a scale, cast iron or any covered pot, and a blade for scoring.

01 mix & walk away

a Weigh the water. Tear the starter into pieces — it gets to work faster.

b White flour in, then whole wheat.

c Mix with a spatula, just to wet the flour. No gluten development yet.

d Cover and leave for autolyse.

30–50
MIN AUTOLYSE

just wet the flour →

02 salt & the honest part

a Salt in. Now knead properly.

b Taste from two spots. One bland, one salty? Keep kneading.

03 26°. the number nobody checks

a	First fold, then measure the dough temperature.
b	26 °C or below. Above it fermentation runs ahead and the dough gets weak.
c	Mine was 27. Oops. First 30 min in the fridge — fixed.
d	Too warm is not a disaster, you cool it down. Next time — mix with cold water.

04 folds & waiting

a A fold every 30 minutes, four in total.

b By the third one you see bubbles. A good sign.

c On the fourth, check the gluten: stretch a piece thin. A window like this is what we want.

d Now wait until the dough grows by 50–60%. Mine took about an hour and a half. And a sunset — sorry for the light.

05 *shape & say good night*

a Preshape: round it, tightening the top. Rest 20–30 min.

b Final shape: I do folds and swaddling. Any method you like works.

c Another 20–30 min proof, then into the fridge overnight, covered.

06 good morning. let's bake

a	Morning. The dough looks like this — time to bake.
b	Turn it out onto a mat, score on the side.
c	The dutch oven has been heating for an hour at 250 °C.
d	Lid on — 20 min. Lid off, down to 220 °C — another 20-25.

250°

TIMING AT A GLANCE — WATCH THE DOUGH, NOT THE CLOCK

a	Autolyse 30-50 min → salt, knead
b	4 folds, every 30 min → bulk until +50-60%
c	Preshape, rest 20-30 min → shape, proof 20-30 min → fridge overnight (~7 °C)
d	Bake 250 °C lid on 20 min + 220 °C lid off 20-25 min

Timing is approximate. A liquid starter may run a little faster or slower than lievito madre.

the ear

listen to that crust

one hour later

and... here it is

Here is our bread. The score opened a bit weakly — that's the volume. In homemade bread that's not the point. The point is taste, craft and love.

taste, craft & love
